

Implementing ISO 14224 taxonomy and equipment model in WellMaster Reliability Management System (WRMS)

Hans Peter Jensen, M.Sc.

Principal Consultant/Product Owner WRMS, Peloton

5th ISO Seminar on International Standardization in the Reliability Technology and Cost Area

Hosted by TotalEnergies, Paris, France - 1 December 2022

This presentation refers to the ISO 14224: 2016 standard

[ISO/TC67/WG4 standards](#)

Peloton WellMaster Reliability Management System (WRMS)

The screenshot displays the WellMaster Reliability Management System (WRMS) interface. The top navigation bar includes 'Simulator', 'Analyser', and 'Viewer' tabs, with the user 'Hans Peter Jenssen' logged in. The left sidebar shows a search bar and a list of component types and filters, including 'TRSCSSV Oil North Sea', 'Component types: TRSCSSV', 'Operators: ExproSoft Oil', 'Countries: Norway', 'United Kingdom', and 'Fluid types: Produced oil'. The main content area is divided into three sections: 'Average failure rate', 'Mean time to failure', and 'Weibull parameters'. The 'Mean time to failure' section shows a table with the following data:

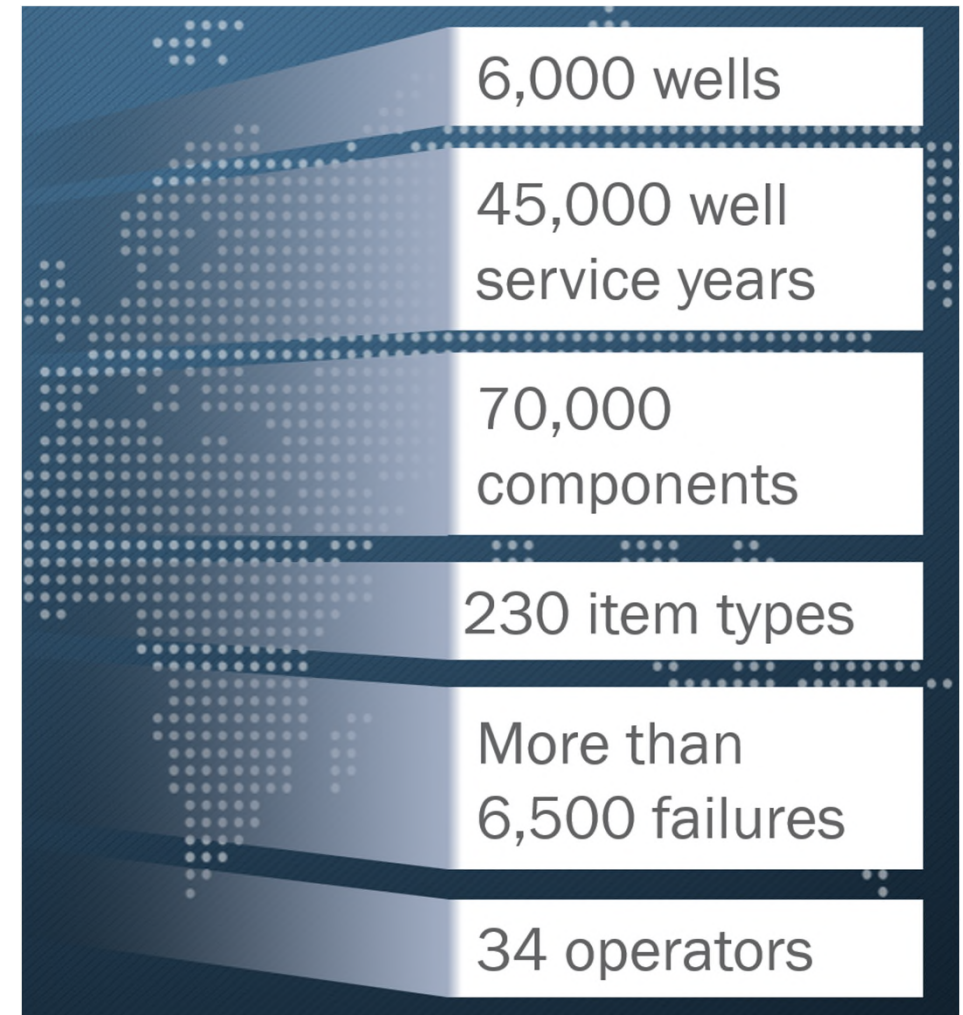

TRSCSSV	MTTF (Y)	LCL	UCL	STDEV
TRSCSSV Oil North Sea	58.243	28.618	257.675	59.875

The 'Weibull parameters' section includes filters for '90% Confidence interval', 'Survival probability', 'Probability plot', and 'Cumulative failure probability'. Below the table is a 'Survival' plot showing 'Probability' on the y-axis (0 to 1) and 'Service time year' on the x-axis (0 to 26). The plot displays a Kaplan Meier curve (solid green line), a Curve Fit (dashed green line), and confidence limits (dotted green lines). A purple callout box on the right side of the plot contains the following text:

- **Viewer:** Browse your Company's own data, download reports, etc.
- **Analyser:** Component reliability analyses, benchmarking, etc. with a wide range of filter options available
- **Well Simulator:** Well lifetime simulations, with costs estimates
- **Database** on wells, equipment and failures (data is frequently added)
- **Integration** with Peloton WellView

WRMS with Industry Database

- Combine Industry data with your Company's own failure data to analyse well component reliability
- Analyse and review Vendor equipment
- Predict failures & required well interventions, downtime, with costs
- The data is anonymized with respect to Operators, Assets and Wells
- The shared database is available to all assigned WRMS license users
- 97 % of the data is related to Wells and includes the XMT with the SCM

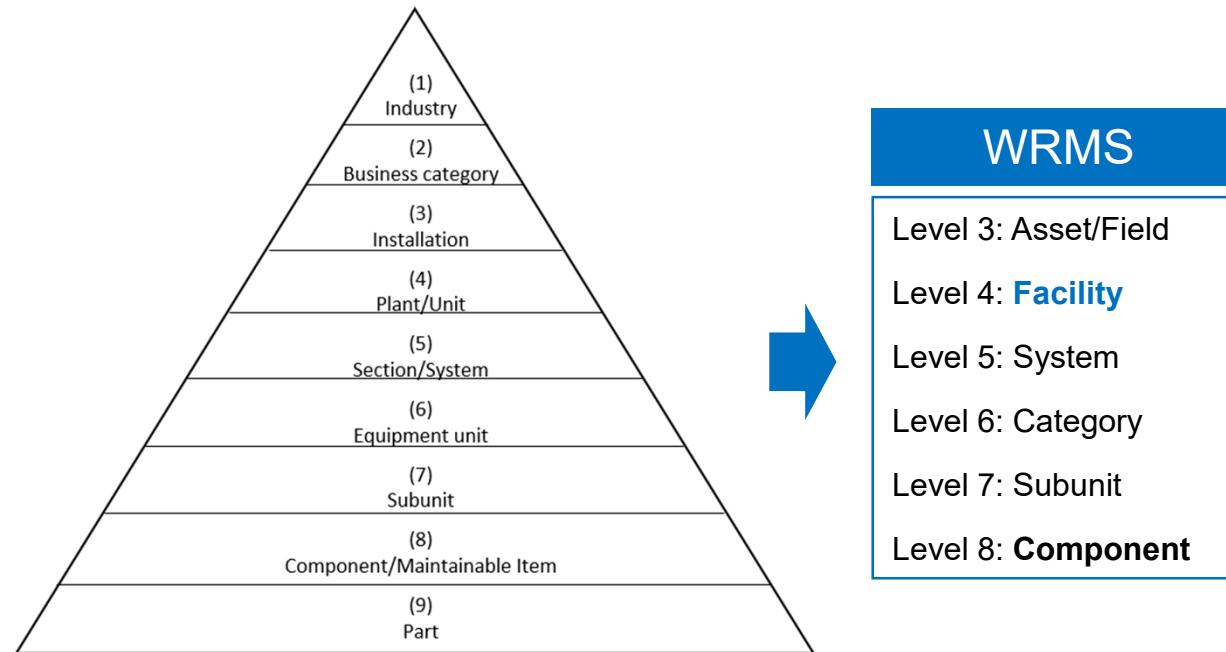

Requirements for the WRMS taxonomy and data model

- Follows recognized international standards and commonly used terminology within the industry, based on a practical adaption to WRMS and the Database structure
- Component types naming (level 8) is important due to pulling and uploading well equipment data from a wide and very diversified range of sources, including failures. Mapping of data is a key issue during the data collection process
- A stringent data model is also required for enabling component analyses:
 - Within an Asset/Field with several installations (offshore platforms, subsea etc)
 - Between different Assets for a specific Operator
 - Between various operators and regions for larger studies and JIPs
- It is fundamental that the data model is not too complex, but that it allows for running analyses on a level where it will provide practical and useful decision support during all well life-cycles. Focus is on the Maintainable items (component types)

WRMS Equipment taxonomy reference ISO 14224

ISO 14224 'pyramid' and the WRMS taxonomy hierarchy

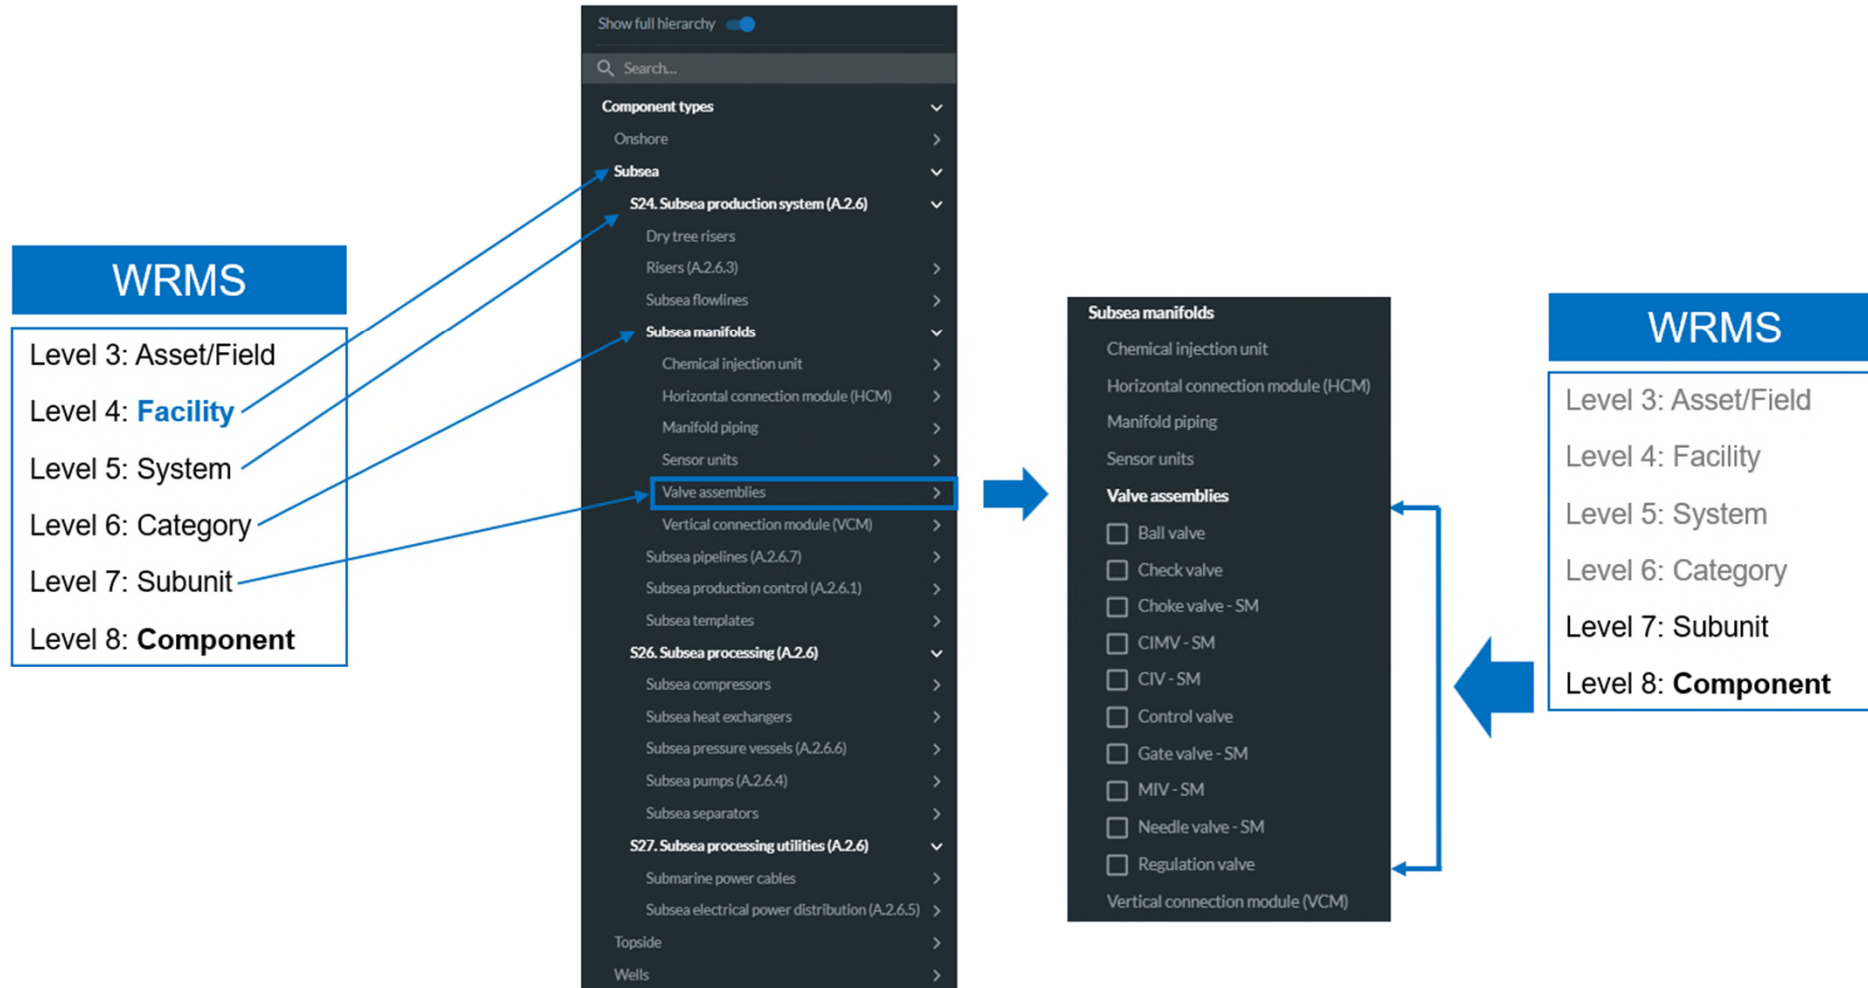

Facilities defined in WRMS (Level 4. **Facility):**

- **Wells (all types of Wells; Onshore, Topside, Subsea, and includes the XMT)**
- **Subsea (Seabed installed equipment and systems not related to the Wells)**
- **All analyses in WRMS are on Level 8: Component (Maintainable Item)**

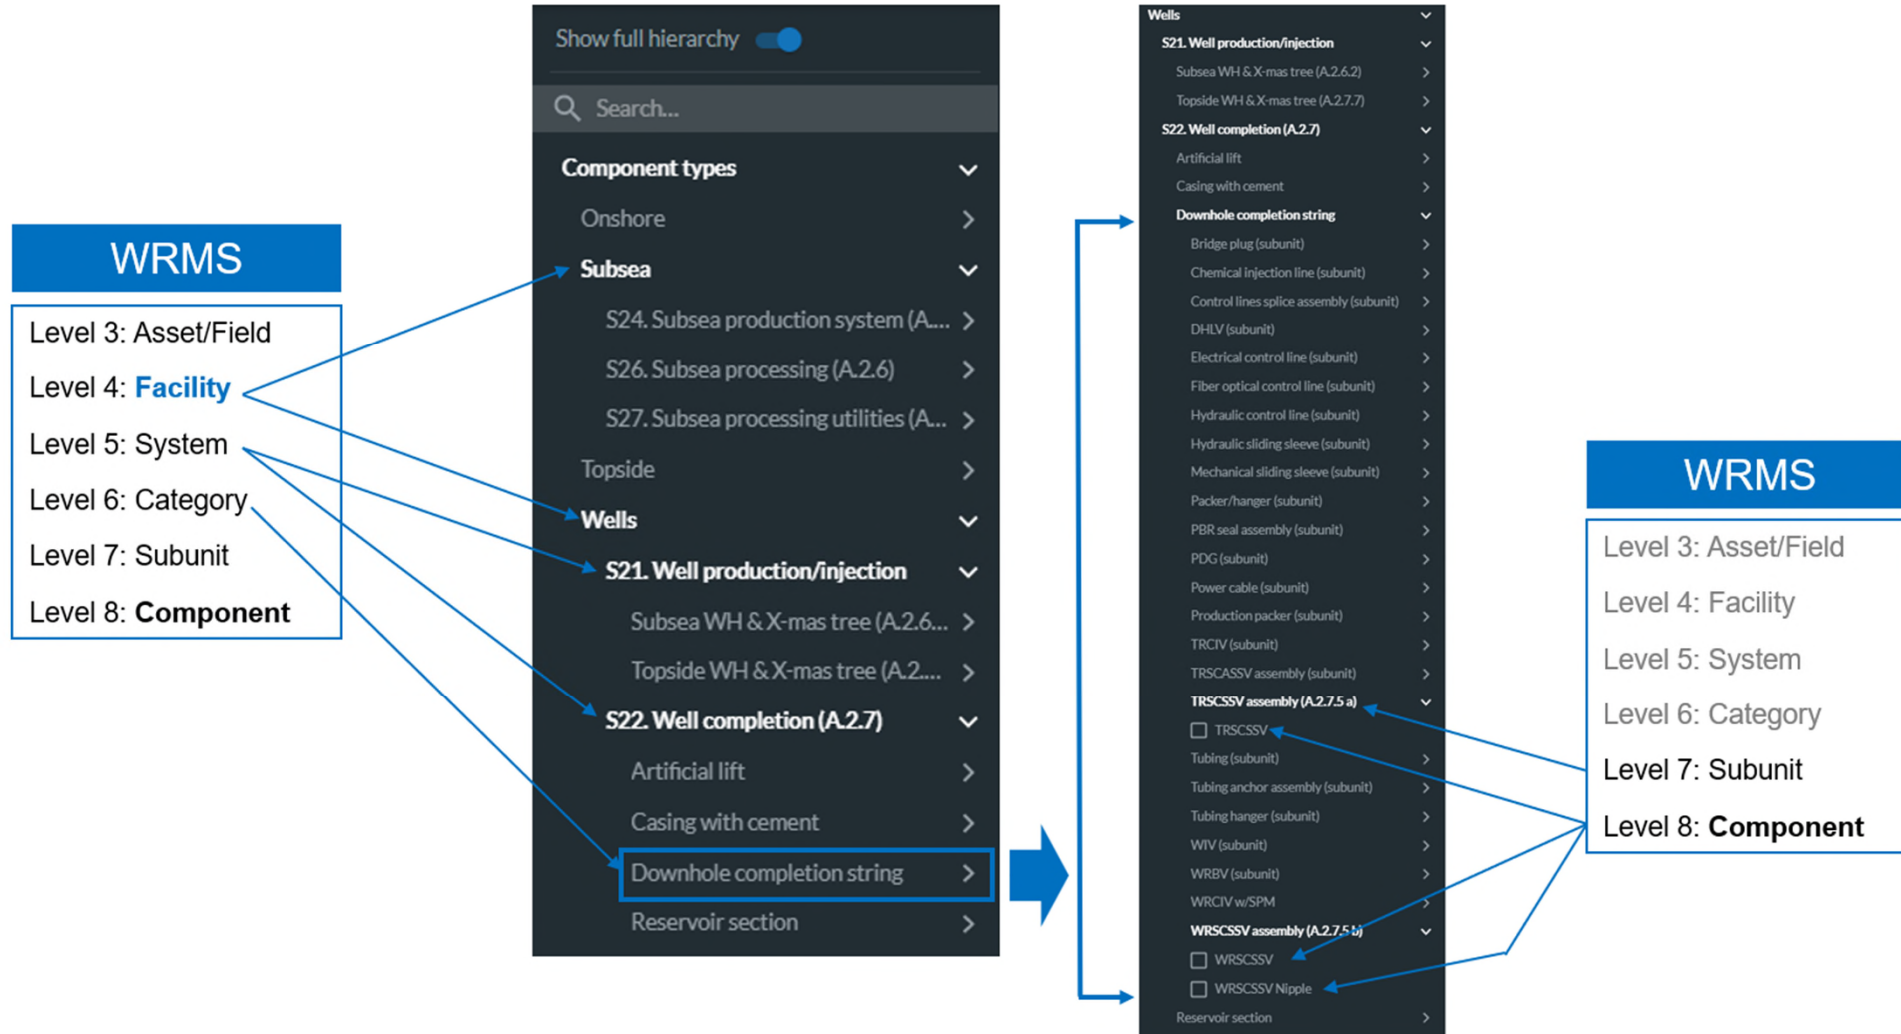

WRMS Equipment taxonomy reference ISO 14224

Facility – Subsea

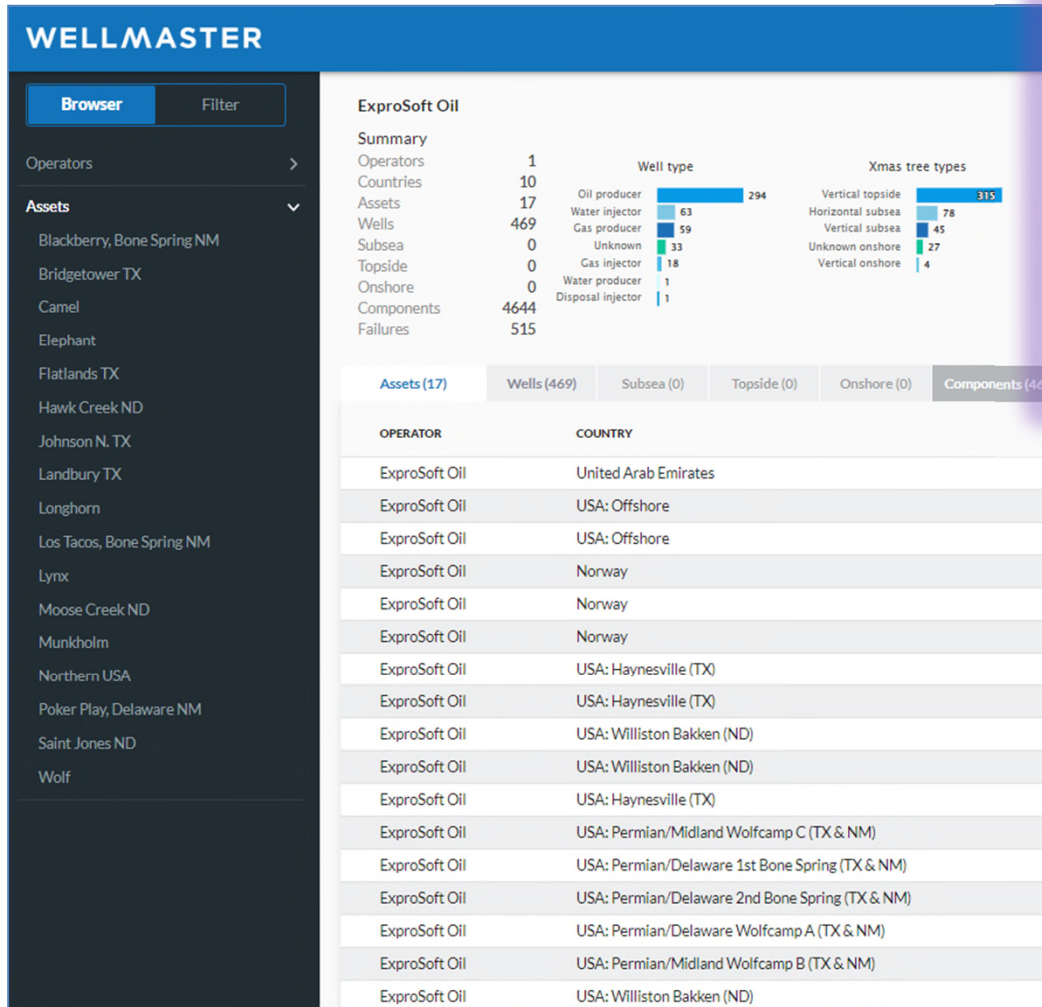

WRMS Equipment taxonomy reference ISO 14224

Facility – Wells

WRMS taxonomy model and data model – level 3

- Well Equipment data belongs to its Well (Well name with well type)
- Well belongs to an Asset or Field, this includes which Country the Asset or Field belongs to
- The Assets (Field names) belong to its Operator
- Data is anonymized wrt Operator, Asset and Well

Well Equipment data model level 8 – details

- Each Component type (level 8) is defined by its name in the hierarchy
- For each Component, data on attributes, features and events is collected
- The Equipment data model is generic for all Component types
- For each Component type, there is a pre-defined set of Failure modes to be applied when uploading failure data to the database
- There is also a generic set of Failure cause categories defined
- Both the Failure modes and the Failure cause categories are filter options when setting up and running Component analyses in WRMS

Well Equipment data model level 8 – details

Component	Working on Production database
Id	7902
ComponentType	TRSCSSV
Vendor	Schlumberger
Model	TRM-4P-CF
ElastomerType	Unknown
MetalType	13Cr
FluidType	
SerialNumber	
PartNumber	TRM-4P-CF 5.5"-13CR80-ID:4.562"
Remarks	
Interface	
InstallationDepthMeter	185
LengthMeter	
InstallDate	31/03/2004
OperationStartedDate	14/04/2004
EndDate	15/11/2013
EndEvent	Pulled
LastDataCollectionDate	15/04/2021
NominalSizeIn	5.5
WorkingPressurePsi	
WorkingTemperatureMinC	
WorkingTemperatureMaxC	
Tag	

Drop-down lists defined for some of the data entries, such as Vendor, Model, Metal type etc

Vendors (5)		
	Fail.	Comp.
<input type="checkbox"/> All		
<input type="checkbox"/> Baker	482	1955

Well Equipment failures – data model

Edit Failure

Component type TRSCSSV
Installation depth 192
Installation date
Well
Asset

Failure date *
2003-04-17

Restored date (without pull)
2003-04-17

Edit note (To be updated later)

Failure cause description *
17.04.2003: 12 PM: SEVERAL UNSUCCESSFUL SCSSV TEST ATTEMPTS, BUT SLAM SHUT WORKED FINE. PROBABLY DUE TO

Sequence of events

Facility status
In Operation (monitoring or periodic test)

Leak rate

Failure mode *
Leakage in closed position

Failure cause category *
Deposit failure

Remarks (data source, source reference etc)
Remedial action details:
CYCLE/SOFT SHUT VALVE TO GET GOOD TEST.

Consequences *
None (Restored date)

Drop-down lists for Failure modes (TRSCSSV) and Failure cause categories (generic):

- Control line to well communication
- Fail to close on demand
- Fail to install
- Fail to open on demand
- Leakage in closed position
- Premature closure
- Unknown
- Well to control line communication

- Deposit failure
- Design failure
- External cascading failure
- Internal cascading failure
- Operational failure
- Physical failure
- Unknown

Results from the reliability analyses in WRMS

Result tabs in WRMS	Notes
Average failure rate (AFR)	Average failure rate per year with confidence interval (LCL and UCL)
Mean time to failure (MTTF)	<p>The MTTF is calculated for the following:</p> <ul style="list-style-type: none"> • The Exponential distribution • The Weibull distribution: <ul style="list-style-type: none"> ○ Weibull 2P MLE (Maximum Likelihood Estimation) ○ Weibull 2P LSE (Least Square Estimation) ○ Weibull 3P <p>Weibull distribution and estimations incorporates the fact that mechanical components experience an increased failure rate over time, for various reasons (such as wear, corrosion, erosion, fatigue, ageing, etc.).</p>
Weibull parameters	Scale and Shape parameters for 2P MLE and 2P LSE, and in addition also the Location parameter for the Weibull 3P model
90% Confidence interval	The Confidence intervals are shown for the AFR, and for the Exponential and Weibull MTTFs
Survival probability	Survival probability curves (curve fit to Kaplan Meier survivor plot function) are shown for the Exponential and Weibull MTTFs
Probability plot	This is the plot with Failure time on the X-axis and Probability on the Y-axis. It is shown under the Weibull parameters tab.
Cumulative failure probability	This is the plot with Service time year on the X-axis and Probability on the Y-axis
Components per time interval	Chart showing number of components installed per time interval (per year)
Failures per time interval	Chart showing number of Failures per time interval (per year)
Failure rate per time interval	Chart showing the Failure rate per time interval (per year)
Failure modes distribution	There is a set of pre-defined failure modes for each Component type in the WRMS data model.
Failure cause categories distribution	A generic set of failure cause categories are defined for all Component types in the WRMS data model

Some concluding remarks

- The ISO 14224 taxonomy model with organizing the equipment has been useful for developing the taxonomy equipment hierarchy in WRMS
- Practical adaptations to the ISO Equipment taxonomy have been necessary
- Flexibility in the WRMS data model allows further changes in the WRMS equipment taxonomy to be more in accordance with ISO 14224 taxonomy, primarily for the subsea installed systems/equipment not related to wells
- The ISO 14224 standard should be developed further also to cover more on taxonomy requirements and guidance for well completion equipment
- For users, WRMS has proved to be a flexible tool when it comes to defining analyses' scope and apply a range of filter settings for analyses
- A structured equipment taxonomy hierarchy is fundamental to achieve this

The WRMS Industry database is being regularly updated
